Patent No. 5478810
GENERAL INFORMATION:
APPLICANT: Stuber, Werner
APPLICANT: Fickenscher, Karl
TILLE OF INVENITION: Peptide Amides, Processes for the
TILLE OF INVENITION: Preparation Thereof and Agents Containing These as
TITLE OF INVENITION: Fibrin/Thrombin Clotting Inhibitors
UNUMBER OF SEQUENCES: 22
CORRESPONDENCE ADDRESS:
ADDRESSEE: ADDRESSE:
ADDRESSEE: Dunner

Ranby M;

The patentors claim a compsn. in which AAP61324 is pref. present at a conc. of equal to or more than, 0.4 (pref. 2) mg./ml. of the compsn. The compsn. can be used in diagnostic tests such as the determ. of the enzyme tissue plasminogen activator as a standard in the detection of trace amts. of fibrin in biological fluids. It may also be administered in vivo to measure the total fibrinolytic capacity of an organism. (Updated on 03-OCT-2002 to add missing OS field.) (Updated on 27-AUG-2003 to correct OS field.) (Updated on 24-OCT-2003 to standardise OS field) Fibrin solubilised with tetra:peptide - used in diagnostic procedures for determining fibrinolysis factors. Claim 2; Page 18; 22pp; English.

Peptide contg. proline - is used for cerebral thrombosis, myocardial infarction etc. due to anti-coagulation activity.

Claim 1; Page 975; 10pp; Japanese.

C-terminal is in amide form. (Updated on 25-MAR-2003 to correct PA

Sequence of peptide which binds to human fibrinogen.

Sequence 4 AA;

0 ô Synthetic peptides beginning with the sequence Gly-Pro-Arg (e.g. GPRP) will bind to fibrinogen and prevent fibrin polymerisation. A scrambling reaction was used to determine whether unique GPR-like peptides could be created from a reaction seeded with GPR if these new products could bind to fibrinogen. See e.g. AAR32379. (Updated on 25-MAR-2003 to correct Gaps Gaps platelet aggregation, fibrinogen A-alpha chain, protein scrambling, GPR-like peptide. In the qualitative or quantitative determn. of thrombin-induced platelet aggregation in the presence of fibrin, interference from fibrin clot formation is suppressed with a fibrin-aggregation inhibitor (e.g., AAM09661-63). The assay may be used to determine the platelet aggregation inhibitory activity of thrombin inhibitors. The peptides inhibit fibrin clot formation at high thrombin concns. without inhibiting platelet

                                                                                                                                                                                                                                                                                                                                                                                                                                   The inventors claim a method for inexpensively and rapidly producing a large and varied population of peptides and screening this varied population of peptides and screening this varied population for the presence of peptides which bind to a target, for example, a macromolecule associated with a particular physiological function. The specific binding peptides are isolated and sequenced, synthesised on a large-scale, their biological activity is demonstrated, and then subjected to clinical testing. The random population of peptides is generated by employing a scrambling system which utilises one or more proteases, esp. papain, pepsin, bromelin, thermolyshin, trypsin, promase, chymotrypsin, subtilism and dipeptidyl peptidase IV. A typical starting protein is casein. Targets are esp. receptors involved in physiological processes, partic. Hibrinogen, sickle cell has been demonstrated that synthetic peptides beginning with the sequence GPR will bind to fibrinogen. Such peptides include GPR, GPRP and GPRV. (Updated on 25-MAR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

AAW25198 and AAW25199 are peptides containing a GPRP sequence. The peptides are capable of binding to cell adhesion molecules and are used in aqueous irrigation solutions for use during and after endoscopic
                                                                                                                                                                                                                                                                                                                                                                                                                                                    GPRP; glycine; proline; arginine; proline; bladder irrigation; cell adhesion molecule; binding; tumour removal; endoscopic operation; transurethral resection; cancer; neoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Endoscopic irrigation solns. - contg. peptide(s) that bind to cell adhesion molecules.
                                                                                                                                                                                                                                                                                                                                                                                       GPRP-peptide capable of binding cell adhesion molecules.
                                                                                                                                                                                  AAW25198 standard; peptide; 4 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        95DE-01029909.

tripoptide, GIV-Pro-Arg is also claimed. This tripoptides sequence tripoptide, GIV-Pro-Arg is also claimed. This tripoptide sequence corresponds to the first 3 amino acids of the alpha-chain exposed by the thrombin catalysed release of the fibrinopeptide A in all vetebrate species. In the present peptide, the addition of a proline residue at postition 4 increases the affinity of the peptide for fibrinogen almost tenfold. These synthetic fibrinogen binding peptides are immobilised on a novel polysaccharide support (e.g. Sephadex), to which they are coupled through a spacer or linker moiety. This linker moiety comprises a chain of greater then 7 atoms. The solid support is useful for the recovery and isolation of fibrinogen from material such as plasma, plasma fractions and fibrinogen by recombinant DNA techniques. The process is superior to other known affinity isolation procedures in that only mild elution buffers are required to recover the bound fibrinogen.
                                                                                                                                                                                                                       ..

operations. Preferred irrigation solutions are electrolyte-free and contain I microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, DDA, DGEA, GPRP, VTL, YIGSR, KOAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours.
                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recovery of fibrinogen using polysaccharide solid support coupled to fibrinogen-binding peptide - requires only mild elution buffers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fibrinogen binding peptide; fibrinopeptide A; fibrinogen isolation.

This sequence represents a targeting ligand directed to the GPIIDIIIA

receptor. The invention relates to a contrast agent for diagnostic

imaging or a target composition which comprises: (1) a lipid, protein or

polymer and (ii) a gas, in combination with (iii) a targeting ligand

(TI). TI targets cells or receptors selected from myocardial,

receptor. Also claimed are a composition comprising vesicles containing

(I) - (iii) and an aqueous carrier; a targeted vesicle composition

(I) - (iii) and an aqueous carrier; a targeted vesicle composition

(I) - (iii) and an aqueous carrier; a targeted vesicle composition

(I) - (iii) and a bloactive agent; and a method for providing an tissues or receptors; a formulation for therapeutic or diagnostic use

comprising (i) - (iii) and a bloactive agent; and a method for providing an internal region of a patient, or for diagnosing the presence

of diseased tissue, comprising: (a) administration of a composition as above; and (b) scanning the patient using ultrasound to obtain a visible useful for imaging or diagnosing the presence of diseased tissue,

comprising and addinosing the presence of diseased tissue,

comprising and cardiovascular regions. In particular the ligand targets regions of arrentosclerosis. Stabilised vesicles are particularly useful for perfusion imaging. The vesicles may also be used to deliver

cuttine agents to an intended target such as tissue or a receptor, and

ultrasound can then be used to promote rupture of the vesicles and

release a bioactive or diagnostic agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Contrast agent or targeted compsn. for imaging or treating diseased tissue - comprising lipid, protein or polymer, a gas, and a targeting ligand e.g. a protein, peptide, saccharide or steroid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                         Pargeting ligand directed to the glycoprotein GPIIb/IIIa receptor.
                                                                                                                                                                              Contrast agent, targeted composition; diagnosis; diseased tissue; glycoprotein GPIIb/IIIa receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

New thrombolytic agents - comprise thrombolytic proteinase covalently linked to targetting compound for binding to component of thrombus. Claim 9; Page 63; 79pp; English.

The invention relates to new thrombolytic agents which comprise a thrombolytic proteinase covalently linked to a targeting compound capable of specifically binding to a component of a thrombus. The thrombolytic agents can be used for eliminating thrombi in vivo in, e.g. myocardial infarction, cerebral ischaemia, deep vein thrombosis or pulmonary embolism. A labelled form of the thrombolytic agent can also be used to image thrombi for diagnostic purposes. The thrombolytic agents are specifically targeted to thrombus sites in vivo and have minimal haemorrhagic side effects and side effects related to non- specific may be used in a fibrin-specific targeting compound. (Updated on 25-MAR-2003 to correct PI field.)

New assays for determination of activity of components in the Protein C anticoagulant pathway, used for the study of diseases such as deep venous thrombosis and pulmonary embolism.

Claim 27; Page 50; 67pp; English

Assays have been developed for the determination of activity of components in the Protein C anticoagulant pathway using additional metal in the protein C anticoagulant pathway using additional metal in the protein C anticoagulant pathway of the assays. An in vitro photometric method for qualitative screening and quantitative determination of the functional activity of components of the Protein C anticoagulant pathway of the protein C anticoagulant activity of the enzyme is related to the protein C anticoagulant activity, in a blood sample of a human comprising coagulation factors and the exogenous substrate after at least partial activation of coagulation through the intrinsic, extrinsic, or common pathway and triggering coagulation by: (1) adding calcium ions; and (2) comparing the conversion rate with the conversion rate of a normal human blood sample determined in the same way, characterized by and comparing the conversion rate with the same way, characterized by cadding further metal (s) ions selected from divalent metal ions and conversion to the sample. The method can be used for the global screening for defects in the Protein C activity in a blood sample, for determination of Free Protein S activity in a blood sample, for determination of Protein C activity in a blood sample, and diseases such as deep venous thrombosis and/or pulmonary embolism. The present sequence repersones a fibrin polymerisation inhibitor for use in a method described in the present invention

                                                                                                                                                                                                                                                                                                                                           This invention describes a novel aqueous suspension of monodisperse particles on non-crosslinked, non-denatured albumin (50-5000 mm) which is stable against dissolving upon dilution with an alcohol-free aqueous medium. The method involves (a) forming an aqueous solution containing albumin and hemoglobin and (b) treating the aqueous solution with an alcohol to cause the solution to become turbid. The particles are useful as agents for in vivo administration, either of their own administration or as a vehicle for other therapeutic or diagnostic agents. The method permits the formation of albumin and hemoglobin particles in the nanometer and micrometer size range, in a form closer to their natural form than the forms of the prior art. The particles therefore constitute a more closely controlled agent for in vivo administration, with greater ease of clearance from the body after their period of usefulness.

```
This sequence represents a peptide that can form the low mol.wt.

component of a novel biologically active factor that is capable of
influencing the differentiation, proliferation and/or maintenance of
pulripotent cells. The factor consists of a low mol.wt. component

component cells. The factor consists of a low mol.wt. component

collar diy-pro-OH-Pro. a peptide given in AAV3378-82, or a protesse

digested (including collagenase digested) collagen fragment, and a high

mol.wt component such as fibromectin. The biologically active factor is

consisted from conditioned media of hepatic or hepatoma cells or cell

lines or extraembryonic endodermal cells or cell lines. The factor is

capable of causing the transition of pluripotent cells (e.g. embryonic

clls having different properties, more specifically primitive ectoderm-

cells having different properties, more specifically primitive ectoderm-

cells having different properties, more specifically primitive ectoderm-

cells colliferation of these cells in vitro. It also allows the

solation and maintenance of EDE cells derived from in vitro and in vivo

primitive ectoderm. These cells can be used in allo, concomitant- or

replacement, and gene therapy. They can also be used for producing

chimeric or transgenic animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Thrombus imaging, fibrin polymerisation site, technetium-99m, Tc-99m,
GPIIb/IIIa receptor, cyclic peptide ligand.

                                                                                                                             This sequence represents the fibrin polymerisation site. The invention relates to a complex (A) for thrombus imaging comprises technetium-99m (TC-99m) completed with a reagent comprising a peptide (P) with 4 to 100 amino acids sequence and a TC-99m binding moiety covalently bound to (P). (P) is selected from a linear peptide ligand for a GPID/IIIa receptor not comprising the amino acid sequence (arginine-glycine-aspartate), a peptide ligand for a polymerisation site of fibrin, and a cyclic peptide ligand for the GPID/IIIa receptor. The thrombus imaging reagents provided by the present invention can be used for visualising thrombi in a mammalian body when TC-99m is labelled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ultrasound method, useful for diagnosis of e.g. thrombi or carcinomas, uses different types of energy for priming and interrogating the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an ultrasound method comprising: (i) administering a targeted vesicle composition (A); and (ii) scanning the subject by exposure to a first type of ultrasound energy and then

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New protected amino-substituted compounds bearing acylated N-methyl-alpha -aminoisobutyryl moiety as amino protecting group, useful e.g. in organic synthesis and in the formulation/delivery of prodrugs with improved
interrogating with a second type of ultrasound energy. (A) consists of a vesicle comprising a lipid, protein or polymer, encapsulating a gas, in combination with a targeting ligand. The method is used to detect: (I) a thrombus (particularly old or echogenic); (II) a low concentration of vesicles; or (III) vesicles targeted to endothelial tissue, particularly those containing integrins associated with malignancy or inflammation in early or small lesions, e.g. atherosclerotic plaque or ovarian, encropubbles and reduces background noise. The method increases the signal from microbubbles and reduces background noise. The present sequence represents a targeting ligand peptide which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 with an acylated N-methyl-alpha-aminoisobutyryl (NMeAib) molety as the amino protecting group. These can be used in chemical synthesis and in drug delivery. They can be used as produgs which have improved blostability or bloavailability. The present sequence is a peptide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes protected amino-substituted compounds

This invention relates to a novel targeted compound having a combination of hydrophobic compound, hydrophilic polymer and targeting ligand. The invention also compities a target vesicle composition comprising lipid, protein or polymer gas filled vesicles in an aqueous carrier, a method for imaging a thrombus in a region of a patient involving administering to the patient a target vehicle composition and scanning the region (preferably cardiac region) with diagnostic imaging (preferably diagnostic ultrasound) and a method for lysing a thrombus in a blood on internal region of a patient which can be used to obtain a visible image of a region (preferably arteriosclerosis, atherosclerotic plaque, infarcted myocardium or a cancer cell) and a method for diagnosing the presence of disease tissue in a patient involving administering a target vehicle composition and scanning the patient using ultrasound to obtain a visible image of the region. The method of the invention may be used for imaging a thrombus in a region of a patient, lysing a thrombus in a blood vessel, diagnosing the presence of diseased tissue in a patient and for the therapeutic delivery in vivo of a placetive agent. The compounds of the invention are easily synthesised and have diagnostic efficacy, and mathod improved targeting a franction over the threatent of the invention are easily synthesised and have diagnostic efficacy over property and a patient and for the method by the presence of diseased tissue or a patient and for the method property argeting efficacy over property argeting a prior of the method of the invention are easily synthesised and have diagnostic of the the the property argeting efficacy over property argeting a parcent of the presence of the property argeting efficacy over property argeting a parcent of the property argeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New targeted compound useful in target vesicle composition for imaging a thrombus in a region of a patient has a combination of hydrophobic compound, hydrophilic polymer and targeting ligand.
                                                                                                                                                                                                                                                                        Target vesicle; diagnostic imaging; thrombus; cancer; arteriosclerosis; atherosclerotic plaque; infarcted myocardium; glycoprotein GPIIbIIIa receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  art methods. The present sequence represents a targeting ligand to the glycoprotein GPIIbIIIa receptor used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match 100.0%; Score 25; DB 5; Length 4; Best Local Similarity 100.0%; Pred. comprising several oligopeptide units and including recognition sites for peptide cleavage. The products of the invention have cytostatic and antibacterial activity, inhibit tumour cell adhesion and can be used to prepare vaccines. The constructs are used for recombinant production of peptides or their mixtures for use as pharmaceuticals, e.g. a mixture of peptides used, in a rines solution, to reduce the high rate of relapse in superficial bladder carcinoma after transurethral resection or as antimicrobial peptides for control of antibiotic-resistant bacteria in human or veterinary medicine. The constructs allow the possible concentration and reduced cost. This sequence represents an oligopeptide described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               encoding a polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                  New DNA construct encoding polypeptide that includes cleavage sites, useful for preparation of pharmaceutical peptides or their mixtures.
                                                                                                               cytostatic; antibacterial; tumour cell adhesion inhibitor; vaccine; bladder carcinoma; transurethral resection; antimicrobial; human medicine; veterinary medicine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ultrasound method; targeted vesicle composition; targeting ligand;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

```
The present invention relates to a novel ultrasound method which involves administering to a patient a targeted vesicle composition which comprises vesicles encapsulating a gas, in combination with a targeting ligand, and scanning the patient using dual frequency ultrasound insonation. The vesicles themselves comprise a lipid, protein or polymer, and are phospholipid selected from diceleles. The vesicles may comprise a comprise a lipid, protein or polymer, and are phospholipid selected from dicelephonophatidylcholine, dipalmitoylphosphatidylcholine, dipalmitoylphosphatidylcholine, dipalmitoylphosphatidylcholine, dipalmitoylphosphatidylethanolamine, of succinyldicleoylphosphatidylethanolamine, 1-hexadecyl-2.

The succinyldicleoylphosphatidylethanolamine and phosphatidylethanolamine, of succinyldicleoylphosphatidylethanolamine, 1-hexadecyl-2.

The succinyldicleoylphosphatidylethanolamine in the succinyldicleoylphosphatidylethanolamine, of succinyldicleoylphosphatidylethanolamine, of second phosphatidylethanolamine, new second insonation frequency to cause the vesicle is oscillating, exposing the patient to a second ultrasound energy having a second insonation of frequency that is different from the first insonation frequency, and detecting the reflected ultrasound signal. The method is useful for detecting the reflected ultrasound signal. The method is useful for thrombus or enhancement of thrombus (e.g. old or echogenine associated with malignancy or cargeted to epithelial calls, tumour cells, myocardial cells, and endothelial tissue including integrins associated with malignancy or enforce of diseased tissue in a patient, and for detecting one or more regions of a patient, such as for providing images of the heart, or ensure the presence or regions of a patient, such as sor providing images of the heart, or ensure the present of ensure the present or more the ensure the present of the ensure the present of ensure the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gastrointestinal region or lymphatic systems. ABU63151-ABU63172 represent targeting ligands that may be used in the method of the present invention
```

synovial or fibroblast cells comprising exposing the cells to a specific tetrapoptide (GPRP) peptide (I). (I) is used for inducing proinflammatory effects in synovial or fibroblast cells. An analogue of (I) is used for treating or preventing inflammation of a synovial joint or rheumatoid arthritis in a subject. (I) is used to identify a receptor for (I) comprising exposing several fibroblastic cells or synovial cells to (I). (I) can identify, isolate and clone the cell receptor to which it binds. This is the amino acid sequence of a fibrin polymerisation inhibiting peptide derived from the human fibrinogen A alpha chain.

The invention describes a method of inducing proinflammatory effects in

Claim 1; SEQ ID NO 2; 16pp; English.

Inducing proinflammatory effects in human synovial or fibroblast cells comprises using a specific tetrapeptide which can also identify a receptor to the tetrapeptide.

The peptides represented in AAR15718-33 are anticoagulants which are more effective than previously known chemically similar cpds. They can be used for therapeutic and diagnostic purposes
                                                                                                   New anticoagulant penta- and hexa:peptide(s) - are Glycine-Proline-Arginine-Proline aminoacid derivs. which inhibit agglomeration of fibrin chains but not thrombin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Blood; fibrin; coagulation; inhibition; thrombin; fibrinogen.

The blood coagulation inhibiting peptide conprises L-form amino acids and has fibrin agglutination inhibiting activity. Such peptides (see AAR60327-860335) were synthesisers (Applied Bloosystems Co., 430A) and purified by high pressure liquid chromatography. To 0.2 m of fibrinogen solution (2.5 mg/ml), 0.2 ml of test peptide solution was added and incubated for I minute at 37 deg Celsius. 0.2 m of thrombin solution was added and the ICSO was determined according to the method of Kawasaki et al. This peptide had an ICSO of 65 micromolar compared with a control peptide of Gly-Pro-Arg which registered an ICSO of 250 micromolar
New blood coagulation inhibiting peptide(s) having fibrin-agglutination inhibitory activity - useful for the treatment and prevention of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 25; DB 2; Length 5; Pred. The blood coagulation inhibiting peptide comprises L-form amino acids and has fibrin agglutination inhibiting activity. Such peptides (see AAR60327 *R60335) were synthesiser (Applied Blosystems Co., 430A) and purified by high pressure liquid chromatography. To 0.2 ml of fibrinogen solution (2.5 mg/ml), 0.2 ml of test peptide solution was added and incubated for I minute at 37 deg Celsius. 0.2 ml of thrombin solution was added and the IC50 was determined according to the method of Kawasaki et al. This peptide had an IC50 of 65 micromolar compared with a control peptide of Gly-Pro-Arg which registered an IC50 of 250 micromolar
                                                                                                                                                                                                  New blood coagulation inhibiting peptide(s) having fibrin-agglutination inhibitory activity - useful for the treatment and prevention of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The blood coagulation inhibiting peptide comprises L-form amino acids and has fibrin agglutination inhibiting activity. Such peptides (see AAR60327 4860335) were synthesiser (Applied Blosystems Co., 430A) and purified by high pressure liquid chromatography. To 0.2 ml of fibrinogen solution (2.5 mg/ml), 0.2 ml of test peptide solution was added and incubated for 1 minute at 37 deg. Celsius. 0.2 ml of thrombin solution was added and the IC50 was determined according to the method of Kawasaki et al. This peptide had an IC50 of 50 micromolar compared with a control peptide of Gly-Pro-Arg which registered an IC50 of 250 micromolar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New blood coagulation inhibiting peptide(s) having fibrin-agglutination inhibitory activity - useful for the treatment and prevention of

Peptides AAW34568-71 are synthetic fibrinogen binding peptides. A tripeptide, Gly-Pro-Arg is also claimed. This tripeptide sequence corresponds to the first 3 amino acids of the alpha-chain exposed by the thrombin catalysed release of the fibrinopeptide A in all vetebrate species. In peptide AAW34568, the addition of a proline residue at position 4 increases the affinity of the peptide for fibrinogen almost refiold. These synthetic fibrinogen binding peptides are immobilised on a novel polysaccharide support (e.g. Sephadex), to which they are coupled through a spacer or linker moiety. This linker moiety comprises a chain of greater then 7 atoms. The solid support is useful for the recovery and isolation of fibrinogen from material such as plasma, plasma fractions and fibrinogen-containing cell culture media arising from the production of fibrinogen by recombinant DNA techniques. The process is superior to
                                                                                                                                                 In the qualitative or quantitative determn. of thrombin-induced platelet aggregation in the presence of fibrin, interference from fibrin clot formation is suppressed with a fibrin-aggregation inhibitor (e.g. AAM09661-63). The assay may be used to determine the platelet aggregation inhibitory activity of thrombin inhibitors. The peptides inhibit fibrin clot formation at high thrombin concns. without inhibiting platelet
                                    Determn. of thrombin-induced platelet aggregation in presence of fibrin comprises use of fibrin aggregation inhibitor to suppress fibrin clot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recovery of fibrinogen using polysaccharide solid support coupled to fibrinogen-binding peptide - requires only mild elution buffers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fibrinogen binding peptide; fibrinopeptide A; fibrinogen isolation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This peptide ligand is immobilised and used for the purification of fibrinogen. Such immobilised peptide ligands can be used in affinity purification strategies. The invention provides a process for inactivating virus that may be present in an aqueous solution containing a free biologically active protein. The process comprises contacting the solution with an immobilised ligand that binds to the protein, subjecting the bound protein to virus-inactivating treatment and releasing the brotein by elution. The ligand is immobilised by being covalently bound to a chromatographic support. The process is used for identifying and inactivating viruses in protein solutions especially thrombin solutions. Binding the protein to a solid phase protects it from denaturation during the virus-inactivating threatment.
                                                                                                                                                                                                                                                                                     Immobilised ligand; inactivation; virus; binding; thrombin; denaturation; affinity; fibrinogen; purification.

This invention describes the use of a ligand for fibrinogen and/or fibrin for preventing microcirculatory disorders and/or for modifying rheology, in mammals. The products of the invention can be specifically used to treat or prevent disorders satisficated with diabetes, retinopathy, polyneuropathy, apoplexy, hearing loss, sepsis, occlusive arterial disease and/or impaired kidney function Reducing the amount of fibrinogen and/or fibrin in the blood alleviates

The present invention relates to peptides based on the alpha- and betachain sequences of fibrin/fibrinogen, which are capable of acting as fibrin antagonists. These are used for the therapy of local and generalised inflammation associated with infection, autoimmune reactions, rheumatic disease, immune system dysfunction or genetic disease, for the prevention and treatment of organ transplantation rejection reactions, arteriosclerosis, reperfusion trauma, thrombotic disease and increased fibrin deposition associated with aging, or for the transport of other medicaments to human or animal endothelial cells. They may also be effective against fibrin-mediated tumour growth, collagenosis or psoriasis. The present sequence is a peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                    Query Match. 100.0%; Score 25; DB 5; Length 5; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                     The present invention relates to peptides based on the alpha- and betachain sequences of fibrin/fibrinogen, which are capable of acting as fibrin matgonists. These are used for the therapy of local and generalised inflammation associated with infection, autoimmune reactions, rheumatic disease, immune system dysfunction or genetic disease, for the prevention and treatment of organ transplantation rejection reactions, arteriosclerosis, reperfusion transm. thrombotic disease and increased fibrin deposition associated with aging, or for the transport of other medicaments to human or animal endotherial cells. They may also be effective against fibrin-mediated tumour growth, collagenosis or psoriasis. The present sequence is a peptide of the invention
                                                                                                                                            Peptides or proteins based on fibrin or fibrinogen sequences, useful for combating fibrin-mediated disorders such as inflammation, transplant rejection, arteriosclerosis and reperfusion damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rheumatic disease; organ transplantation; arteriosclerosis; reperfusion trauma; thrombosis; anteriosclerory; antibacterial; immunosuppressive; antirheumatic; antiarteriosclerotic; vasotropic; thrombolytic; anticoagulant; cytostatic; antipsoriatic.

The blood coagulation inhibiting peptide conprises L-form amino acids and has fibrin agglutination inhibiting activity. Such peptides (see AAR60327-R60335) were synthesised using a peptide synthesiser (Applied Biosystems Co., 430A) and purified by high pressure liquid chromatography. TO 0.2 ml of fibrinogen solution (2.5 mg/ml), 0.2 ml of test peptide solution was added and incubated for 1 minute at 37 deg. Celsius. 0.2 ml of thrombin solution was added and the ICSO was determined according to the method of Kawasaki et al. This peptide had an ICSO of 70 micromolar compared with a control peptide of Gly-Pro-Arg which registered an ICSO of 250 micromolar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fibrin-alpha-chain; Tc-99m thrombus detection; deep venous thrombosis; DVT; pulmonary embolism; PE; cell image; technetium-99m.

This peptide is used in the composition of the invention which comprises a radiolabelled agent used for imaging mammalian tissue or cells. The composition is administered to a mammal at a target site, the radiolabelled moiety binds to fibrin and can be detected to show sites of thrombus. The composition is used to image mammalian cells or tissues, preferably thrombus, particularly deep venous thrombosis (DVT) and pulmonary embolism (PE)
/note= "The C-terminal has a TC-99m-complexed peptide of formula NH2-Gly-Ala-Gly-Gly-CO-NH- condensed onto it"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Characterizing a target that binds to a ligand, useful in concentrating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Method of imaging cells or tissues such as thrombus, particularly deep venous thrombosis and pulmonary embolism comprising using novel radiolabeled fibrin-alpha-chain peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ligand; target; matrix; binding characteristic; isoform; enantiomer; modification; fVIII; factor VIII; vWF; von Willebrand's factor.

```
This sequence represents a ligand which binds fibrinogen. This ligand was identified using the method of the invention for characterizing a target identified using the method of the invention for characterizing a target that binds to a ligand, The method comprises transferring at least a portion of the target one target within the second matrix, where the position of the ligand-support complex to a second matrix, and detecting the target on the second matrix. The support corresponds to the position of the ligand-support complex within the second matrix. It is matrix, and detecting the target on the second matrix. The support conder that binds to a ligand or in determining preferred conditions under which a target or any molecule is transferred to the second matrix. It also provides a means to study the binding characteristics of the target and/or ligand. The method is also useful in separating isoforms and enantiomers from a sample. Detecting target-ligand binding of the invention avoids modification of the target for detection, enables detection avoids modification of the target via its biological, blochemical or chemical activity compared to currently available detection rethingues which have potential drawbacks, namely modification charget-detection systems already exist. Immited number of targets for which detection systems already exist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Producing a primate neural cell, useful for treating Parkinson's disease,

The invention comprises a method for producing a primate neural cell, the method involves culturing a pluripotent primate cell with a MEDII conditioned medium. The method and the primate neural cell of the invention are useful for treating a neural disease, such as: Parkinson's disease, Huntington's disease, lysosomal storage diseases, multiple macular degeneration. The neural disorders, Alzheimer's disease, and macular degeneration. The neural cells are also useful for testing the effect of molecules on neural differentiation or survival, in toxicity functions. The present amino acid sequence represents a proline-containing peptide that may be used in the MEDII conditioned medium in the method of the invention.
Alzheimer's disease, Huntington's disease, or macular degeneration, comprises culturing a pluripotent primate cell with a MEDII conditioned

Reagent for scintigraphic imaging of thrombi with 99m technetium -comprises synthetic peptide which binds to thrombus covalently coupled to

metal binding gp., rapidly cleared from blood and tissue. Claim 19; Page 42; 61pp; English.

The invention relates to reagents for scintigraphic imaging of a thrombus in-vivo, comprising (A) a specific binding compound capable of binding to at least one component of a thrombus, covalently linked to (B) a technetium-99m-binding moiety. Specific peptides constituting the reagents are claimed as new. The present peptide is one such peptide, in which the Cys(Ann) Gly-Cys(Asm) moiety is the 99m-Tc binding moiety and the residue constitutes the thrombus- binding component. (Updated on 25-MAR-2003 to correct PN field.)

Sequence 16, Application US/09779054

Patent No. US200201201201

Patent No. US2002012012012

APPLICANT: Lu, Xinjie

APPLICANT: Lu, Xinjie

APPLICANT: Kakkar, Vijay

TITLE OF INVENTION: USE OF DENDROASPIN AS A SCAFFOLD FOR NON-DENDROASPIN DOMAINS
FILE REFERENCE: A-70312/TAL/AMS

CURRENT APPLICATION NUMBER: US/09/779,054

CURRENT FILING DATE: 2001-02-05

PRIOR APPLICATION NUMBER: GB 0002625.2

PRIOR APPLICATION NUMBER: GB 0002625.2

NUMBER OF SEQ ID NOS: 21

SOFTWARE: Patentin version 3.0 RESULT 1 US-09-779-054-16 SEQ ID NO 16 LENGTH: 4 TYPE: PRT

```
Secure 25, Application US/10308644

Publication No. US20030229017A1

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Wu, Shih-Kwang

APPLICANT: Chang, Ting-Gung

APPLICANT: Shih, Kea-Shyang

TITLE OF INVENTION: Conjugates Synthesized Thereby and Targeted Liposomes Containing

FILE REFERENCE: P1379

CURRENT APPLICATION NUMBER: US/10/308,644

CURRENT PILING DATE: 2002-12-03

NUMBER OF SEQ ID NOS: 29

SOFTWARE PREDENT NOS: 29
